Every trial demo version of Techsmith Camtasia was the product of laborious coding, researching, designing and testing. It was just a matter of days before the growing number of people who were sharing their serial numbers on various forums attracted the attention of Techsmith's employees. Once they had identified that there was a problem with the way that their trial versions were being cracked, Techsmith began to investigate what could be done to close down all leaks and make sure this didn't happen again in future releases. They realised that since all user data is stored locally on computer hard drive (rather than server), it would be impossible to limit access by IP address or other methods. Techsmith knew that the only way to stop people hacking their trial versions would be to close off access to their own trial versions. So, Techsmith looked at how they could release future versions of Camtasia without giving the public access to the source code which is required for this. Because Camtasia uses .NET framework (version 2.0 or higher) for its coding, because the source code is not released, it was impossible for TechSmith to prevent unrelated developers from modifying Camtasia's source code and then releasing their own versions of Camtasia which were incompatible with TechSmith's trial versions (which meant that all previous trial versions would crash when run). So, Techsmith's only option was to remove all traces of Camtasia from its own website and replace it with a "Coming Soon" message. TechSmith needed to find a way of releasing future versions of Camtasia without giving the public access to the source code which is required for this. This is how TechSmith began to develop a new version of Camtasia called "Camtasia Studio". The new trial versions which are released are actually just demos. They are just the first few chapters in order to get you interested in buying the full version once it is released. The idea behind Camtasia Studio is that it's a completely new version of Camtasia, and this allows the developer to avoid the problems that they encountered with releasing Camtasia without giving the public access to its source code. With Camtasia Studio, you already have access to every feature of Camtasia, so you can use it as soon as you're ready. The new trial versions were released as part of TechSmith's response to the problem of users re-copying trial versions and sharing their serial numbers with others. The new trial versions are not available on TechSmith's website; they are only available from its Facebook page. TechSmith have released Camtasia Studio 1.0 only to the public, but they are planning on releasing other trial versions very soon . Camtasia Studio is a video created by TechSmith software which allows you to record your screen activity and edit it down to very short videos. It also allows for audio recording. It does this using technology similar to Windows Movie Maker, although it offers more options than WMM. Camtasia Studio is only available for Windows-based computers (both 32-bit and 64-bit).
